

# IND320 CA3 Ivar Eftedal

NB! The map does for some reason not show on chrome but it does work on safari. I do apologise for this inconvenience.

## Use of AI

- AI was used a lot for the streamlit. For the jupyter notebook i did not use ai at all for this assignment, but i might have used it for assignment 2. Therefore the code might be somewhat ai generated, but all of what was editet for this assignment was done without external help. It was mostly fairly simple to use previous code and make some small altercations to get the code that i needed for this assignment. For the streamlit i used ai to convert the matplotlib plots all to plotly so that they are more dynamic. I also used a lot of ai to create my pages as well as for debugging. Most of the work done without the use of ai was getting the right data as well as making the plan and architecture for the project. When it came to the decision of what libraries to use, adding simple features or making extensive changes i usually did them myself to lay a foundation for the ai to alter on later. I found that doing everything with ai there would be a lot of mistakes as weird code snippets. For example i experimented with trying claude, but it wrote way too much code for my taste which made me lose control of what was being implemented so i did not use it. And just stuck with using the free tier of chatgpt that rather gives small snippets to implement.

## Log of compulsory work

- Working on this project was a mix of smooth experiences and real challenges. I found doing the jupyter notebook the easiest as it was very similar to the second assignment so there was a lot i could take of code from there. Retrieving hourly production data from the Elhub API and processing it for storage in MongoDB and Cassandra felt straightforward. Overall, the Jupyter part felt understandable and manageable, and I actually enjoyed diving into the data exploration and processing steps.
- In contrast, the Streamlit app turned out to be much harder. Refactoring static plots into dynamic Plotly visualizations was rewarding, but figuring out page structure, menus, and interactive selections required a lot more trial and error than I expected. The mapping component, in

particular, has been tricky. While I successfully integrated GeoJSON overlays for the Price areas and implemented interactive features like storing clicked coordinates and highlighting selected areas, I ran into a frustrating issue: the map only renders properly in Safari and doesn't display at all in Chrome. This has been a major headache, and I've spent a lot of time trying to troubleshoot it without a complete solution yet. Despite this, seeing the map work on safari felt exciting, and it's satisfying to know the underlying logic is correct. Other aspects of Streamlit, like snow drift calculations, wind rose visualizations, and dynamic forecasting with SARIMAX, were challenging but fun once they started working. I especially liked seeing the results respond interactively to user input.

## Experience with jupyter notebook and streamlit

- This time it all pretty much went smooth, apart from forgetting to save files occasionally which was frustrating but not really a jupyter or streamlit problem. This is the assignment where i have enjoyed working with jupyter notebooks the most and still really enjoyed streamlit.

## Choice of additional task

### Forecasting

- Add eather properties to the list exoogenous variables and download them when needed.

## Reflection

Using the Streamlit sliding window correlation tool, I might have noticed some correlations between meteorological variables and energy production or consumption are subtle under normal conditions. However, during extreme weather events, patterns might become somewhat more pronounced for example, energy demand increases when it gets very hot or very cold. I also notice that sometimes the effects don't happen immediately, there can be a bit of a delay before the energy response shows up. Overall, the correlations are most pronounced during unusual or intense weather events if there are any.

## Getting into the code:

### Import dependencies

```
In [5]: import os
import sys
import requests
import pandas as pd
import matplotlib.pyplot as plt
from pymongo import MongoClient
from pyspark.sql import SparkSession
from cassandra.cluster import Cluster
from pyspark.sql.types import StructType, StructField, StringType, DoubleType,
from pyspark.sql import functions as F
```

### Ensure cassandra connector is loaded

```
In [6]: os.environ["PYSPARK_SUBMIT_ARGS"] = (
    "--packages com.datastax.spark:spark-cassandra-connector_2.12:3.5.1 pyspark
)

# Defining some essential constants
BASE_URL = "https://api.elhub.no/energy-data/v0/price-areas"
START_YEAR = 2022
END_YEAR = 2024
KEYSPACE = "elhub_data"
TABLE = f"consumption_{START_YEAR}_{END_YEAR}"
```

### Connect to cassandra

```
In [7]: cluster = Cluster(['localhost'], port=9042)
session = cluster.connect()

# Create keyspace if it does not exist
session.execute(f"""
CREATE KEYSPACE IF NOT EXISTS {KEYSPACE}
WITH REPLICATION = {{ 'class': 'SimpleStrategy', 'replication_factor': 1 }};
""")

session.set_keyspace(KEYSPACE)

# Drop and recreate table so that i dont get too much data in the database whi
session.execute(f"DROP TABLE IF EXISTS {TABLE};")
```

```

# Creating the structure of how the database should look
session.execute(f"""
CREATE TABLE IF NOT EXISTS {TABLE} (
    priceArea text,
    consumptionGroup text,
    quantityKwh double,
    startTime timestamp,
    endTime timestamp,
    meteringPointCount int,
    lastUpdatedTime timestamp,
    PRIMARY KEY ((priceArea, consumptionGroup), startTime)
);
""")

```

Out[7]: <cassandra.cluster.ResultSet at 0x322169d60>

## Fetch data from API

```

In [8]: # Creating an empty list that will store the data for each entry
records = []

for year in range(START_YEAR, END_YEAR + 1):
    # Loop over all months of the year
    for month in range(1, 13):
        start = f"{year}-{month:02d}-01"
        end = f"{year + 1}-01-01" if month == 12 else f"{year}-{month + 1:02d}"
        url = f"{BASE_URL}?startDate={start}&endDate={end}&dataset=CONSUMPTION"

        print(f"Fetching data for {start} until {end}")

        # Save the request as json format
        response = requests.get(url).json()

        for item in response.get("data", []):
            attributes = item.get("attributes", {})
            consumption_list = attributes.get("consumptionPerGroupMbaHour", [])

            if isinstance(consumption_list, list):
                for column in consumption_list:
                    records.append({
                        "priceArea": column.get("priceArea"),
                        "consumptionGroup": column.get("consumptionGroup"),
                        "quantityKwh": column.get("quantityKwh"),
                        "startTime": column.get("startTime"),
                        "endTime": column.get("endTime"),
                        "meteringPointCount": column.get("meteringPointCount"),
                        "lastUpdatedTime": column.get("lastUpdatedTime"),
                    })

        print(f"Finished fetching. Total records: {len(records)}")

```
